

March on Washington Math Lesson

During the March on Washington 250,000 people came to march and listen to speakers like Martin Luther King Jr. You are going to make a representative map of all the people who were there.

1. Since you won't have 250,000 sticker dots, figure out how many you will need to represent the 250,000 people who attended the March.
2. Arrange them on the map so you can experience how many people were there.
3. Make sure to make a key to show how many people equal 1 sticker dot.
4. You may also decide to represent the percentage of white and black attendees with different color push pins see the pie chart below for help:

80% were black and 20% were white

6. The areas below equal 20% each. Shade in the correct number of sections to represent the percentage of black and white people who attended the March.

Percentage of Black and White People at the March on Washington
